	Care manager on duty: you notified 09:12:06 - unacknowledged				
	Duty supervisor at 09:16 if unacknowledged				
	Registered family member urgent alert - 2h response window				
	Chain assembled at run time from severity, time of day and duty roster.				

Corresponding ERD

Visit and Incident sit as the two poles; Supervisor, Elder and Caregiver each occupy their own lane between them, so no relationship line crosses another.

Corresponding ERD

An Absence Report from a Caregiver vacates their Visits, which the Supervisor reassigns.

```
graph TD
    CAREGIVER -- submits --> ABSENCE_REPORT
    SUPERVISOR -- reroutes --> VISIT
    SUPERVISOR -- assigned_to --> VISIT
    ELDER -- receives --> VISIT
    ABSENCE_REPORT -- vacates --> VISIT
```

The ERD diagram illustrates the relationships between five tables: CAREGIVER, SUPERVISOR, ELDER, VISIT, and ABSENCE_REPORT. CAREGIVER (PK: caregiver_id) submits ABSENCE_REPORT (PK: absence_id, FK: caregiver_id). SUPERVISOR (PK: supervisor_id) reroutes VISIT (PK: visit_id, FK: elder_id, FK: caregiver_id) and is assigned to VISIT. ELDER (PK: elder_id) receives VISIT. ABSENCE_REPORT (FK: status) vacates VISIT.

VISITS

ON TIME

ISSUES

12

11

1

Your mother had all twelve visits this week, eleven on time. Her blood pressure was slightly high on three mornings and normal on the rest. She ate breakfast at every visit and walked to the corridor and back on Tuesday and Friday.

One problem was reported: the bathroom grab rail is loose. A care manager has logged it and it is scheduled for repair on 30 August.

Describes what was recorded. Not medical advice.

Publish family reports

Open operations report

Corresponding ERD

One Report per elder/audience, generated by the Supervisor for a given period.

```
graph TD
    SUPERVISOR[SUPERVISOR  
int supervisor_id PK  
string name]
    ELDER[ELDER  
int elder_id PK  
string name]
    REPORT[REPORT  
int report_id PK  
int elder_id FK  
int supervisor_id FK  
date period_start  
date period_end  
string audience  
text body  
string status]

    SUPERVISOR -- generates --> REPORT
    ELDER -- covered_by --> REPORT
```

The diagram illustrates the relationships between three database tables: SUPERVISOR, ELDER, and REPORT.

- SUPERVISOR** table:
 - Columns: `int supervisor_id` (PK), `string name`.
- ELDER** table:
 - Columns: `int elder_id` (PK), `string name`.
- REPORT** table:
 - Columns: `int report_id` (PK), `int elder_id` (FK), `int supervisor_id` (FK), `date period_start`, `date period_end`, `string audience`, `text body`, `string status`.

Relationships:

- SUPERVISOR** to **REPORT**: A one-to-many relationship labeled `generates`. The `REPORT` table has a foreign key `supervisor_id` pointing to `supervisor_id` in **SUPERVISOR**.
- ELDER** to **REPORT**: A one-to-many relationship labeled `covered_by`. The `REPORT` table has a foreign key `elder_id` pointing to `elder_id` in **ELDER**.

never

CHECKLIST TO BE USED

☐ Tasks performed match the care plan

☐ Evidence submitted matches what was observed

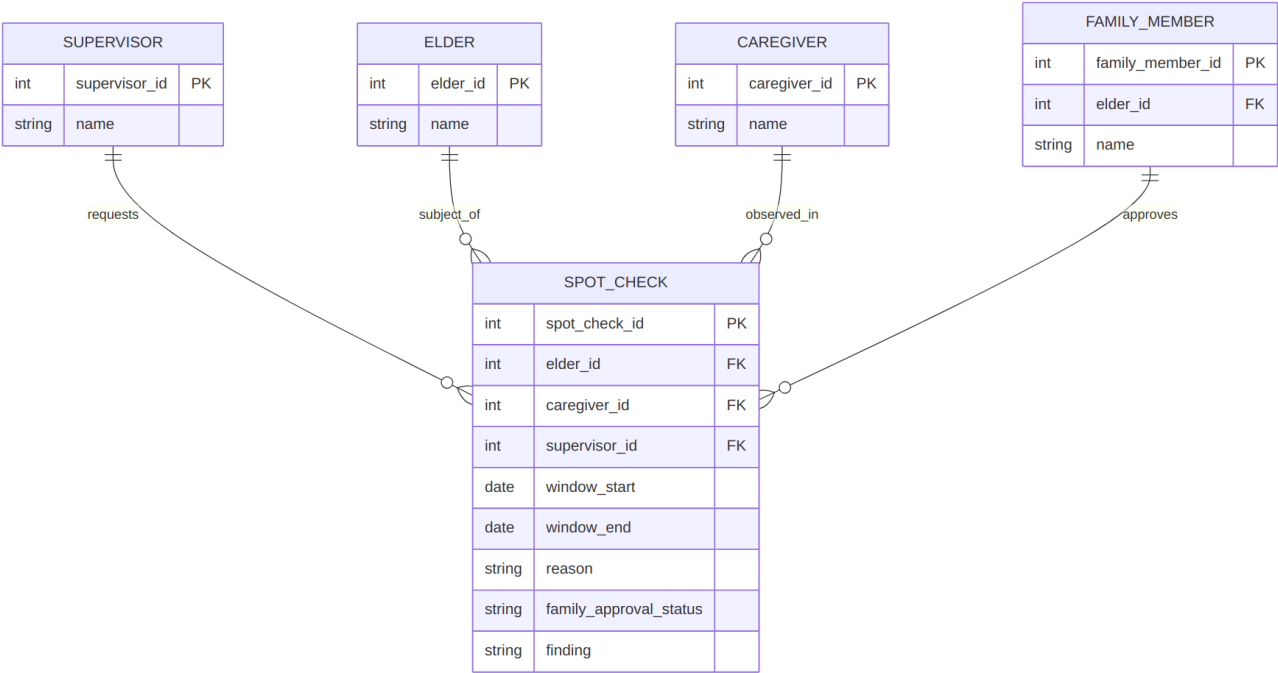

☐ Home hazards

☐ Elder's own comment, recorded verbatim

A spot check produces its own record, linked to the visit it observed. It never overwrites the caregiver's closure.

Corresponding ERD

A Spot Check links Elder, Caregiver and the Supervisor requesting it, gated by Family approval.

11 Sep elders' phones show the new name

A family that declines returns the visit to this queue. It does not fall back to the original caregiver, who is on approved leave.

Corresponding ERD

Visit fans out to all four related tables in one non-crossing sweep; Supervisor-Absence Report-Caregiver forms a short chain above it.

How it all comes together

Merging the per-screen ERDs above into one schema: 12 tables in total, with Supervisor, Elder, and Caregiver at the center and every record table arranged around them by who it connects to. Some crossing near the middle is unavoidable — Supervisor, Elder, and Caregiver all connect to Visit, Incident, and Spot Check alike, which is the smallest pattern that can never be drawn crossing-free — but grouping by relationship keeps each table's connections easy to trace.
